the fish closer and closer together until the moment of attack. The grayfish, sand sharks, and some other species work in schools and do not hesitate to attack the fish taken in the fishermen's nets, the larger forms tearing the nets and liberating the catch. Others, as the smooth grayfish and the blue shark, are noted for their keen sense of smell. Swimming lazily along until it scents its prey, perhaps a crab hidden in a tuft of seaweed, the smooth grayfish turns and rapidly moving its head from side to side begins a systematic search over the bottom, circling closer and closer to the hidden prey, which it seizes with a rush and quickly swallows. The basking shark of temperate waters and the whale shark of the Tropics are the largest of our fishes and at the same time among the most helpless and inoffensive. Their teeth are of little use, food being obtained in the same manner as with the baleen whales, by straining the small plant and animal forms living in the waters of the sea through their highly developed gillrakers. At certain seasons, the first of these—the basking shark—is gregarious, the schools swimming lazily along or lying motionless at the surface of the water with their backs awash. The most serious charge that has been made against the second—the rare whale shark—is that it sometimes rubs itself against the passing small boat, upsetting it, though it makes no attempt to molest the occupants thus unceremoniously cast into the sea.

The economic uses to which these forms may be put are somewhat varied. At one time large quantities of the hides, cleaned, but not tanned, were used for polishing wood, ivory, metal, and the like. With improvements in methods of preparation of sandpaper and emery, these have largely replaced animal hides. However, small quantities of certain classes are still in demand among cabinetmakers, and for other special uses, as in optical fittings. Peculiarity of markings and character of the small, close set, variously sculptured, calcareous particles which cover the skin have adapted some to uses for sword grips, card cases, jewel boxes, and other novelties. The demand for sword grips is at present unusually large and difficult to supply with satisfactory material. Within the last year the Bureau has interested American tanners to experiment in the production of leathers from these hides with excellent results, and there now exists a demand for large quantities of raw materials. In tensile strength leathers tested compare favorably with those made from mammal hides, and the market for these products appears assured. In addition, the livers are rich in a marketable oil, which is of value in dressing leather, soap making, paints, and for medicinal purposes. The yield varies from less than a pint in some of the smaller sharks to about 125 gallons in some of the larger sizes.

The meat of sharks is white, slightly gelatinous, resembling halibut, but somewhat less firm, and compares favorably in food value with other staple food fishes and meats. Russel J. Coles, who has eaten the flesh of many of our sharks, states that the flesh in freshly killed examples of some species has a peculiar odor which can readily be removed by salting. After several hours the meat should be freshened, then parboiled and cooked as any other fish. The flesh of the young sharks and such small forms as the grayfishes is particularly good fresh, but it is as a preserved product that the meat of sharks especially commends itself. Salted and smoked or kippered it is excellent. It may also be salted and dried, flaked or shredded. In some

10.2.6/24/18 TX747-113

parts of the meat the layers of connective tissue are quite close together. These parts may conveniently be run through a meat chopper and the meat used for fish balls, chowders, and the like. Persons in position to smoke the fish as needed will find the mild-cured, hot-smoked product particularly appetizing. Of its qualities, one who has tested it says, "One may compare it with halibut, haddock, cod, and salmon only to record its essential superiority in every particular of tenderness and flavor. In the matter of light smoking, I regard the shark as enormously superior to any fish for this process, for in the samples from which I partook, there was a complete absence of the strong fish flavor which is so hard to eliminate from light-smoked halibut and salmon."

The housekeeper is not restricted to the use of the accompanying recipes, but may employ any method of cooking applicable to large fishes, whether fresh, salt, or smoked. Bacon and salt-pork fats may be substituted for butter in many cases. By some methods of preservation the fish will be found to be so salt as to require considerable soaking; by others so fresh as to require little or none. To freshen salt fish, place them, flesh side down in a large volume of water and leave them there for 12 to 48 hours, according to taste and the size and thickness of the fish. Change the water several times. The extraction of the salt may be hastened if the fish be raised above the bottom of the container by placing it on a wire tray or several clean sticks of wood and, if the fish be thick, by making deep incisions in the flesh. Less freshening is required if the fish be boiled or otherwise cooked in liquid than if used for broiling or frying. Recipes given for canned shark may be used for fresh shark, provided the latter is first boiled until thoroughly done. The cook should use her own discretion with the particular material at hand.

Few grains cayenne pepper.

In the bottom of a baking dish place a layer of bread crumbs or rice, spread over it a small amount of chopped pickle, onion, and fat. 1 cupful milk or cream.
 $\frac{1}{2}$ cupful bread crumbs.

2 table-spoonfuls butter.

Salt and pepper to taste.

Drain and flake the shark. Butter a baking dish and spread a layer of the fish on the bottom. On top of this place a layer of bread crumbs, dust with a little pepper and salt, dot with small lumps of butter, and sprinkle with onion, finely minced. Proceed in this way until the dish is full, being sure that the top layer is of crumbs. Pour the milk or cream over top and dot with lumps of butter. Bake for 30 minutes in a rising oven—an oven in which the intensity of the heat is gradually increased.

29. SHARK SALAD.

1 pound can of shark.
1 cupful finely chopped celery.
2 teaspoonfuls lemon juice.
3 large table-spoonfuls mayonnaise.

1 table-spoonful tomato catsup.
